RT "Sequence analysis of rat integrin alpha E1 and alpha E2 subunits: rissue expression reveals phenocypic similarities between intraepithelial lymphocytes and dendritic cells in lymph.";

RI Sur. J. Immunol. 27:3070-3079(1997).

CC -!- SUBCELLULAR LOCATION: Type I membrane protein (By similarity).

CC -!- SIMILARITY: Belongs to the integrin alpha chain family.

subunits where one of the subunits has one or more mutations, an altered surface feature or an amino acid substitution or internal deletion, extracellular domains of the integrin beta subunit that comprise a mutation that alters a non-oysteine residue to cysteine or extracellular domains of integrin alpha and beta subunits. The polypeptide of the invention demonstrates antipsoriatic, thrombolytic, anticoagulant, osteopathic, cytostatic, immunosppressive, antifullammatory, neuroprotective and antisickling activities and may be useful for immunotherapy in order to prevent or treat an integrin-mediated disorder such as an inflammatory disorder, an autoimmune disorder, thrombosis, cancer, osteoporosis, sickle cell anaemia, psoriasis and multiple sclerosis. The current sequence is that of the human integrin alpham subunit precursor protein of the invention.
                                                                                                                                                                                                                                                                                                                                                             144 CPQEDSDIAFLIDGSGSIIPHDFRRMKEFVSTVMEQLKKSKTLFSLMQYSEEFRIHFTFK 203

Diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual, comprises detecting the expression level of

genes

```
The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic slet, lung, bone marrow or stem cell transplant rejection, rechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a protein that is encoded by the mRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          323

Compounds that modulate alpha-d binding could be used to treat diseases such as type-I diabetes, atherosclerosis, multiple sclerosis, asthma, psoriasis, lung inflammation, acute respiratory distress syndrome and rheumatoid arthritis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mac-1 alpha subunit is involved in the response to inflammation, i.e. recognition of and migration to sites of inflammation. It also attaches to cellular substrates as part of this function making it useful in visualising endothelial tissue. Mac-1 is a member of the Integrin Gene superfamily. Integrins are a class of membrane-associated molecules that participate in cellular adhesion. Integrins are made up of an alpha subunit and a beta subunit. One class of human integrins are restricted to expression in white blood cells and have a common beta2 subunit: the leukocyte integrins, Leu-CAMS, leukointegrins or beta2 integrins. Beta2 integrins have an important role in immune and inflammancyr responses. The present protein sequence is the human integrin alpha subunit collin. This sequence was used in an alignment to identify a novel beta2 integrin alpha subunit: alpha (AAA60014 and AAB07359). The present sequence has subunit alpha (AAA60014 and AAB07359). The present sequence has a suproximately 60% identity to the protein sequence of alpha d. The Alpha d gene and protein may be useful in therapy for diseases linked to aberrant alpha d function e.g. Type I diabetes, atheroselerosis, multiple distress syndrome, rheumatoid arthritis and leukocyte adhesion deficiency (LAD). In addition, anti-alpha d monoclonal antibodies may be used in the system injury. The monoclonal antibodies can also be used to detect and diagnose Crohn's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of novel anti-alpha integrin d monoclonal antibodies to inhibit macrophage infiltration and reduce inflammation at central nervous system

This invention relates to a modified integrin-I or integrin I-like domain polypeptide comprising at least one disulfide bond so that the domain is stabilised in a desired conformation. The polypeptide of the invention may have antiinflammatory or immunosuppressive activities. The polypeptides of the invention have an open conformation and are useful as immunogens to produce antibodies that selectively bind to integrin I-domain, and for identifying a modulator of integrin activity, or of interaction of an integrin and a cognate ligand. The polypeptide of the invention, or antibodies (preferably anti-LFA-I antibody) is useful for treating or preventing an integrin mediated disorder which is an inflammatory or autoimmune disorder in a subject and for inhibiting the

binding of an integrin to a cognate ligand such as Crohn's disease, nephritis; human immunodeficiency virus (HIV), myocardial infarction, Sjorgen's syndrome; rheumatoid arthritis, dermatitis. A therapeutic composition comprising the peptide of the invention is useful for treating an integrin mediated disorder in a subject. The polypeptides and/or active or antigenic fragments are useful as reagents for diagnosis of integrin-mediated disorders. The present sequence represents the human polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                             ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    203

The invention relates to promoting locomotor recovery, inhibiting autonomic locomotor damage, limiting locomotor impairment, or limiting autonomic and sensory dysfunction following spinal cord injury by administering an anti-alpha d (Beta2 integrin alpha2 subunit) monoclonal antibody to a spinal cord injury victim. The method also involves the use of a ligand compart call adhesion molecule, twascular cell adhesion molecule, twascular cell adhesion molecule). The method is useful for promoting component, or limiting autonomic and sensory dysfunction following spinal cord injury. In particular, the spinal cord injury comprises compression of the spinal cord. The antibodies are also useful for reducing inflammation at the site of a central nervous system injury. The specification also details the identification of Beta2 integrin alpha cond, for use in raising the antibodies. Beta2 integrins are implicated in diseases such as LAD (leukocyte adhesion deficiency, inflammatory response, diabetes, multiple sclerosis, arthritis, garfit ather subunit sequence is colitis, immune complex alveolitis and leukaemia. The present sequence is a beta2 integrin alpha subunit sequence included for comparison with the

The invention comprises structurally biased variant integrin inserted (I) domain proteins, wherein the alterations to the protein occur in at least two noncontinuous regions. Specifically the the variant integrin I domain proteins are structurally biased to exist in the open conformation, thereby altering the binding ability of the protein. The invention also comprises nucleic acids encoding the variant integrin I domain proteins.

The integrin I domain proteins and nucleic acids are useful for treating, preventing or suppressing integrin related inflammatory and immunological disorders (e.g. rheumatoid arthritis). The variant integrin I domain proteins and nucleic acids can also be used for treating: ischaemia/ repertusion (e.g. hypovolemic shock); infarction; cerebral shock; viral infection; and cancer The variant integrin I domain nucleic acids and infection; and cancer The variant integrin I domain nucleic acids and chective agents. The present amino acid sequence represents the Mac-1 alpha subunit of integrin

Sequence 1153 AA;

The invention relates to a binding domain-immunoglobulin fusion protein comprising a binding domain polypeptide that is fused to an immunoglobulin hinge region polypeptide, an immunoglobulin have region polypeptide that is fused to the hinge region polypeptide that is fused to the hinge region polypeptide comprises: a wild-type human iggin immunoglobulin havy chain CH2 constant region polypeptide, and an immunoglobulin heavy chain CH3 constant region polypeptide, and an immunoglobulin hinge region polypeptide comprises: a wild-type human iggil immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine residues; where the mutated human iggil immunoglobulin hinge region polypeptide contains 2 cysteine residues, where the first cysteine is not mutated; a mutated human iggil immunoglobulin hinge region polypeptide contains or more cysteine residues, where the mutated human iggil immunoglobulin hinge region polypeptide contains or oysteine residue; and a mutated human iggil immunoglobulin hinge region polypeptide contains on cysteine residues. The binding domain-immunoglobulin hinge region polypeptide contains on cysteine residues. The binding domain-immunoglobulin hinge region polypeptide contains on cysteine residues. The binding domain-immunoglobulin hinge region polypeptide contains on cysteine residues are an isolated polymuleotide and contains on antigen. Also included are an isolated polymuleotide encoding the antiging the polymuleotide (operably linked to a promoter), an eccombinant expression construct comprising the polymuleotide (operably linked to a promoter).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        construct, producing the binding domain-fimmunoglobulin funcion protein, a pharmaceutical composition comprising the binding domain-fimmunoglobulin funcion protein, a pharmaceutical composition comprising the binding domain-immunoglobulin fusion protein or polymucleotide and a carrier, and treating a subject having or suspected of having a malignant condition or a B-cell disorder. The binding domain-immunoglobulin fusion protein is useful for treating a subject having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, carcinoma or sarcoma, rheumatoid arthritis, mysthenia gravis, Grave's disease, type I diabetes mellitus, multiple sclerosis or autoimmune disease, the present sequence is a binding domain immunoglobulin fusion protein-associated protein sequence. Note: The and is also available in electronic formed directly from USPTO electronic formed content of the printed specification and is also available in electronic formed circum mucles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                New binding domain-immunoglobulin fusion protein, useful for treating a subject having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, Grave's disease or autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             segdata uspto gov/sequence.html?DocID=20030118592. The authors have not identified the sequences in the printed specification by their SEQ ID number therefore none of the sequences can be explicitly identified.

The invention relates to a Factor B analogue that exhibits modified complement activity in vitro. The analogue is generated by substituting a short consensus repeat domain (SCR) or a von Willebrand Factor domain (WP) of human factor B with a SCR or a vWF from a second protein such as human complement activity or an account for substantial tissue damage in a wide variety of autoimmune complex mediated syndromes and mysathenia gravis. Inhibition of the complement system using the analogues is likely to provide a means of the complement system using the analogues. Inhibition of complement may also be favorable in cases that involve tissue damage caused by vascular injury such as myocardial infarction, cerebral vascular accidents or contribute to the destruction of partially damaged tissue as in contribute to the destruction of partially damaged tissue as in reperfusion injury. In addition, the use of complement analogues with cover target specificities could reduce the activity of tissue damaging proteins at sites of inflammation. Complement inhibition is important in the prevention of xenograft rejection (the inhibition of complement by cell-associated and soluble inhibitors is useful in protecting the transplant from damage caused by activation of endogenous complement. The present sequence represents the vWF domain of human factor MAC-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Factor B analogue; modified; complement activity; complement factor B; short consensus repeat domain; von Willebrand Factor domain; human; C2; CR3; autoimmune response; tissue damage; lupus erythematosus; therapy; rheumatoid arthritis; hemolytic anemia; myasthenia gravis; injury; MAC-1; myocardial infarction; acute shock lung syndrome; inflammation; vWF.

Novel high affinity integrin polypeptide useful for treating restenosis and parasitic diseases, comprises all or part of variant integrin alpha subunit A domain or variant integrin beta subunit A-like domain.

3xample 2, Fig 5, 55pp, English.

The invention relates to a high affinity integrin polypeptide comprising all or part of a variant integrin alpha subunit A domain or a variant integrin beta subunit A-like domain. The polypeptide, preferably the CD11b alpha subunit A-like domain. The polypeptide, preferably the CD11b alpha subunit A domain, where I at residue 312 has been replaced by C, or V at residue 313 and A at residue 320 have been replaced by C, or CD1 for determining if a test compound is a candidate compound for binding for determining if a test compound is a candidate compound for binding to the polypeptide and determining if the test compound binds to the polypeptide. The integrin subunits are useful for reducing skeletal muscle injury, for treating disorders caused by ischaemia-reperturion injury, immune complexes, restnosts and parasitic diseases, to purify variant integrin polypeptide liqands and as bait proteins in two-hybrid or three-hybrid assays. This sequence represents the human integrin alpha subunit CD11b A domain

AAB66766

AAB66766 standard; protein; 216 AA. AAB66766;

Amino acids 149-353 of human CR-3 alpha chain and His tag. (first entry) 10-APR-2001

EST; expressed sequence tag; inclusion body; binding partner; immunoglobulins.

Homo sapiens.

Synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                  The present invention relates to generating a specific binding partner to a peptide, encoded by a genomic DNA fragment or an expressed sequence tag (EST). A nucleic acid molecule encoding a fusion protein is expressed in a host cell to allow the formation of inclusion bodies comprising the fusion protein, the inclusion bodies are isolated and a specific binding partner is generated. The specific binding partners generated are useful for identifying and characterizing naturally occurring proteins e.g. as immunoglobulins or fragments in immunoassays
                                      Generating specific binding partners to (poly)peptides encoded by genomic DNA fragments, involves forming inclusion bodies by expressing the (poly)peptide as part of fusion proteins.
                                                                                                                                                                                                                                                                                                    PNPRSLVKPITQLLGRTHTATGIRKVVRELFNITNGARKNAFKILVVITDGEKFGDPLGY 125

A fusion protein comprises a glutathione-S-transferase fusion partner, used to increase the level of soluble protein expression in B. coli and to facilitate affinity purification, and the human leukocyte beta-1 integrin Mac-1 I-domain, linked by Factor-Xa recognition sequence that allows cleavage of the fusion protein and recovery of the I-domain, which is useful as an antiinflammatory. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 290

The invention relates to a high affinity integrin polypeptide comprising all or part of a variant integrin alpha subunit A domain or a variant integrin alpha subunit A domain or a variant integrin beta subunit A-like domain. The polypeptide, preferably the contegrin beta subunit A domain, where I at residue 332 has been replaced by C CDLIb alpha subunit A domain, where I at residue 332 has been replaced by C or varieties 313 and A at residue 320 have been replaced by C, or varieties 313 and A at residue 320 have been replaced by C, is useful to varieties a compound is a candidate compound for binding to CDLIb or for treating an inflammatory disorder, by contacting a test compound with the polypeptide and determining if the test compound binds to the polypeptide. The integrin subunits are useful for reducing to the polypeptide. The integrin polypeptide ligands and as bait proteins in two-hybrid or three-hybrid assays. This sequence represents a human integrin alpha subunit CDLIb deletion variant A domain. Note: This cariant sequence is not featured in the specification but has been derived from the wild-type protein shown in AAU76847
                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel high affinity integrin polypeptide useful for treating restenosis and parasitic diseases, comprises all or part of variant integrin alpha subunit A domain or variant integrin beta subunit A-like domain.

Sequence 4, Application US/09945265

Sequence 4, Application US/09945265

Patent No. US20020123614A1

GENERAL INFORMATION:

APPLICANT: Spiringer, Timothy A.

APPLICANT: Spiringer, Timothy A.

APPLICANT: Spiringer, Timothy A.

TITLE OF INVENTION: MODIFIED POLYPEPTIDES STABILIZED IN A.

TITLE OF INVENTION: DESTRED CONFORMATION AND METHODS FOR PRODUCING SAME

FILE REFERENCE: CBN-002CP

CURRENT APPLICATION NUMBER: US/09/945,265

CURRENT PILING DATE: 2001-08-31

PRIOR APPLICATION NUMBER: US 60/229,700

PRIOR PILING DATE: 2000-09-01

NUMBER OF SEQ ID NOS: 4

SEQ ID NO 4

Sequence 3, Application US/08482293A

Patent No. 5831029

GENERAL INFORMATION:

APPLICANT: Gallatin, W. Michael

APPLICANT: Van der Vieren, Monica

TITLE OF INVENTION: No. 5831029el Human 2 Integrin Alpha Subunit

NUMBER OF SEQUENCES: 103

CORRESPONDENCE ADDRESS:

ADDRESSEE: Marshall, O'Toole, Geretein, Murray & Borun
                                                                                                                                                                                                                                ö
